

AMENDMENT

In the claims

Please cancel claims 1-47 and add the following new claims 48-67:

48. (new) An electroporation device, comprising:
- a. a needle-free injector configured to serve as a first electroporation electrode when positioned in contact with a tissue of a patient, wherein the needle-free injector injects at least one liquid jet to introduce an agent into or beneath the tissue;
 - b. a second electroporation electrode disposed in spaced relation to the first electroporation electrode; and
 - c. electrical connections to electrically connect the needle-free injector and the second electroporation electrode with an electrical source for generating electrical current used to effect electroporation.
49. (new) An electroporation device according to claim 48 wherein the second electroporation electrode comprises a ring electrode.
50. (new) An electroporation device according to claim 48, wherein the second electroporation electrode comprises an array of electrodes.
51. (new) An electroporation device according to claim 50, wherein said array of electrodes comprises a micropatch electrode.
52. (new) An electroporation device according to claim 51, wherein said micropatch electrode comprises a meander electrode.
53. (new) An electroporation device according to claim 48, wherein said electrodes further

comprise timing sensors.

54. (new) An electroporation device according to claim 48 wherein the second electroporation electrode is also a needle-free injector.

55. (new) An electroporation device according to claim 48 comprising a plurality of needle-free injectors, each of which is configured to serve as an electroporation electrode, and wherein the device comprises electrical connections to electrically connect each electroporation electrode with the electrical source.

56. (new) An electroporation device according to claim 48 wherein the needle-free injector serves as the first electroporation electrode by injecting a conductive fluid comprising the agent and specific resistivity sufficient to allow application of an electrical field to effect electroporation of the tissue.

57. (new) An electroporation device according to claim 56, wherein the liquid jet acts as an electrode.

58. (new) An electroporation device according to claim 56, wherein the conductive fluid is contained in a partially ionized solvent.

59. (new) An electroporation device according to claim 56, wherein the application of an electric field takes place without the device touching the tissue.

60. (new) An electroporation device according to claim 56, wherein the agent is in a liquid and the injector forces the liquid into the tissue as a conductive or essentially non-conductive liquid jet.

61. (new) An electroporation device according to claim 48 wherein the electrical source is a pulse generator.
62. (new) An electroporation system comprising the electroporation device of claim 48 in electrical communication with an electrical source used to effect electroporation.
63. (new) An electroporation system according to claim 62, wherein the current generated by the electrical source is a wave pulse selected from the group consisting of a square, rectangular, triangular, and an exponential decay wave pulse.
64. (new) An electroporation system according to claim 63, wherein the pulse is monopolar or bipolar.
65. (new) An electroporation system according to claim 63, wherein the pulse is monopolar or bipolar.
66. (new) An electroporation system according to claim 62, wherein the electrical source is a pulse generator.
67. (new) An electroporation device, comprising:
- a. an array electrode comprising (i) at least one positive electrode and at least one negative electrode, wherein the electrodes are configured to generate an electrical field to effect electroporation of a tissue of a patient when energized, and (ii) an opening through which a needle-free injector can be inserted, wherein the needle-free injector injects a liquid jet comprising an agent into or beneath the tissue; and
 - b. electrical connections to electrically connect the array electrode with an electrical source for generating electrical current used to generate the electrical field to effect electroporation.
